# Security Incident Response with Jamf

Keep your organization and users safe with better and faster security incident responses.

Security incident response is a critical function of a successful security program put forth by IT or Information Security teams within an organization. It is such a core component that the National Institute of Standards and Technology (NIST) has written multiple **guides** highlighting its use and importance.

At a basic level, there are four steps:

| PREPARATION | DETECTION AND ANALYSIS | CONTAINMENT ERADICATION AND RECOVERY | POST-INCIDENT ACTIVITY |

Jamf Protect — an endpoint protection solution built exclusively for Mac — gives IT and security teams timely notifications when an incident may have occurred and provides the tools to analyze exactly what happened. While containment, eradication and recovery processes are often custom built in the Windows world, Jamf brings this functionality to the Mac so teams can respond and remediate the next time a security incident takes place.

Jamf has been helping organizations respond to security incidents on Mac for well over a decade and offers core features to ensure devices, users and networks remain protected:

ISOLATE MACOS DEVICES IMPLICATED IN AN INCIDENT
Prevent a compromised machine from causing further damage using Jamf to automatically reduce network access, resource access, block removable media and monitor device activity.

REMOTE FILE/SETTING REMEDIATION
Remotely eradicate malicious files, reset device security settings, run commands and even remove unwanted applications from compromised machines with Jamf.

RECOVER UNTRUSTED DEVICES
Reset your users back to a safe state by redeploying macOS and the applications to the device with Jamf remotely.

APPLY STRICTER SECURITY
Enforce and monitor security settings or add third-party applications or developers to a blacklist to minimize risk on endpoints.

Unprecedented visibility. Industry-leading remediation capabilities. 100% Mac.

The need for better device protection is at an all-time high. Especially with more employees working remotely and potentially across unsecure networks.

Jamf offers tools to streamline your security incident reports and help you take action immediately. Get started today with a free trial.
